SPACE Air Libre - Stand 29

STRAW DISTRIBUTOR

The Multi'Spread can be adapted to a tractor with a front loader, on a tractor with three rear points, and on telescopic handlers. It spreads a very large number of light products intended for animal bedding and makes it possible to easily change from one product to another. With the "lateral ejection bow" patented by Emily in May 2018, the straw blowing angle can be reduced to only 21°. Indeed, the breeder has the possibility to carry out precision straw re-laying for poultry production, and to lay straw in the cubicles on one side on or both sides at the same time, for dairy cattle breeders. The Multi'Spread improves the productivity of tasks inherent to laying straw. This is the case for large width bedding by replacing bedding rotors with bedding plates. These plates make it possible to lay straw from 12 to 15 meters in one pass. For the bedding phase, the double-effect hydraulic control of the carrying machine has to be actuated. This will turn the screw horizontally placed at the bottom of the bucket and actuate the rotors which eject material. The screws direct the material through two lateral openings above the two rotors. Then, these two fast-rotating rotors spread material over a wide spectrum on ground. The user can personalize his bucket : "hexagonal" traps for chopped straw (x 2), "round" control traps for sawdust and pellets (x 2), lateral distribution winglets (on both sides), adjustable ejection bow patented, spreading plates for large width. The standard model is designed to receive all options.
